CC CareerCompiler

GUIDE

How to use CareerCompiler.

You enter a resume and a job description. Then you choose what you need: a career match verdict, a tailored resume, or a cover letter. This page walks through each.

> The screenshots show the real interface running on **synthetic data**. The candidate and postings are invented, and a scripted stand-in replaced the language model during capture. The matcher, the solver, both gates, and the entailment model in these pictures are the real ones.

START

Enter your resume and the job description

TASK 1

Career match: should you apply?

TASK 2

Resume: generate it, then modify it

TASK 3

Cover letter

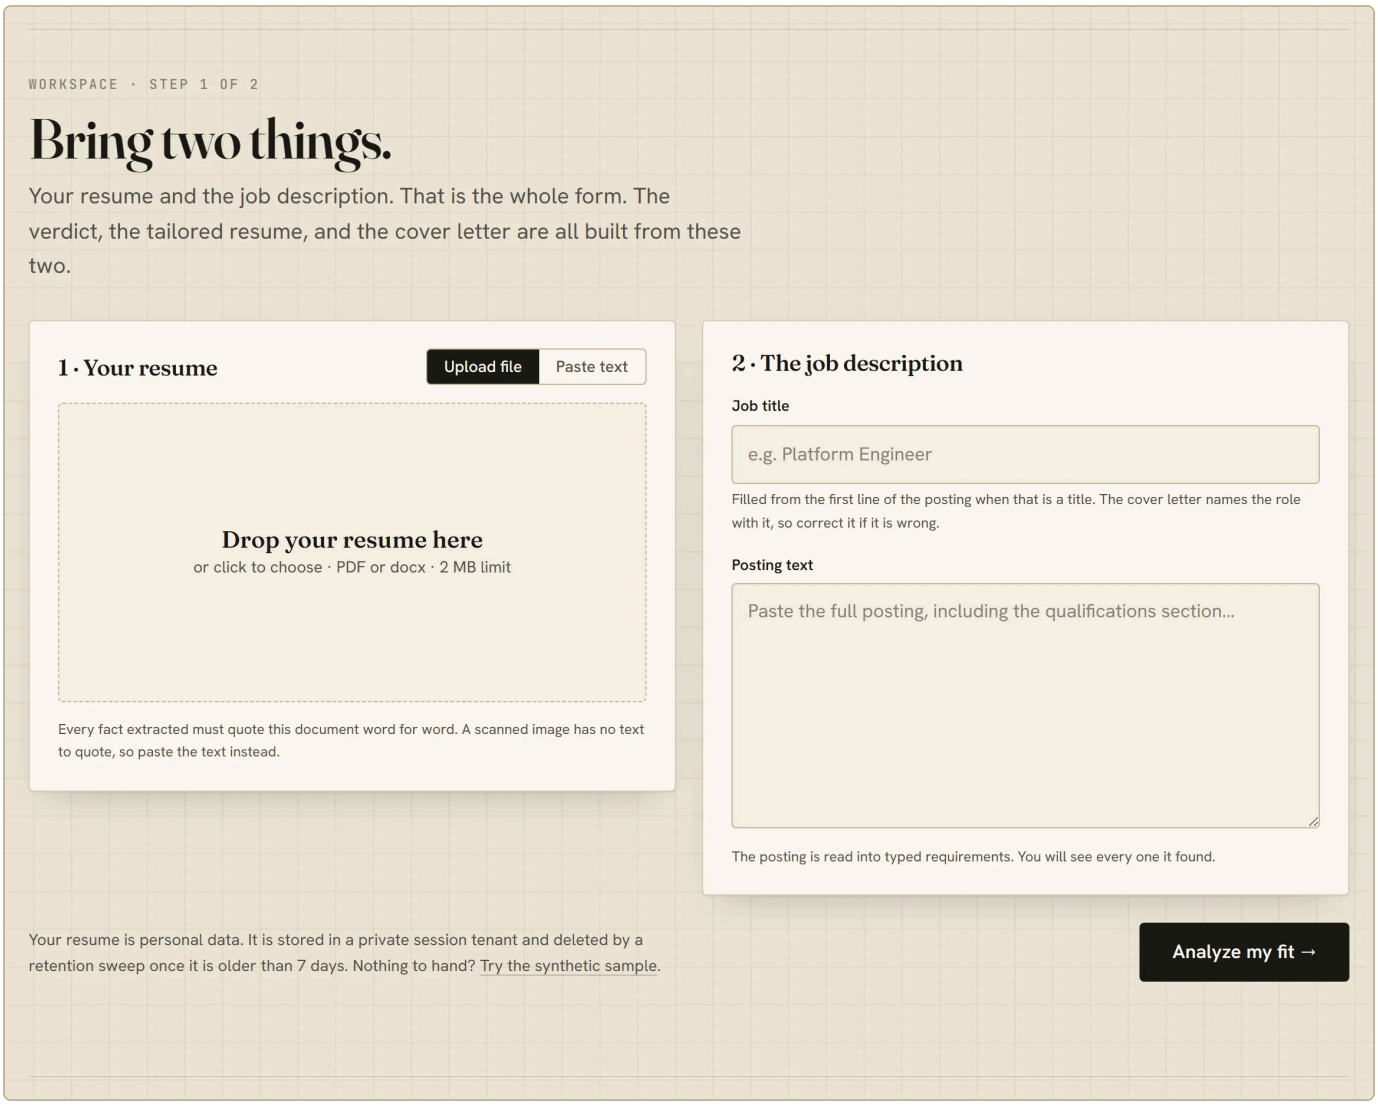

START

Enter your resume and the job description

Two inputs. Nothing else is asked for, and there is no account to create.

1 Add your resume

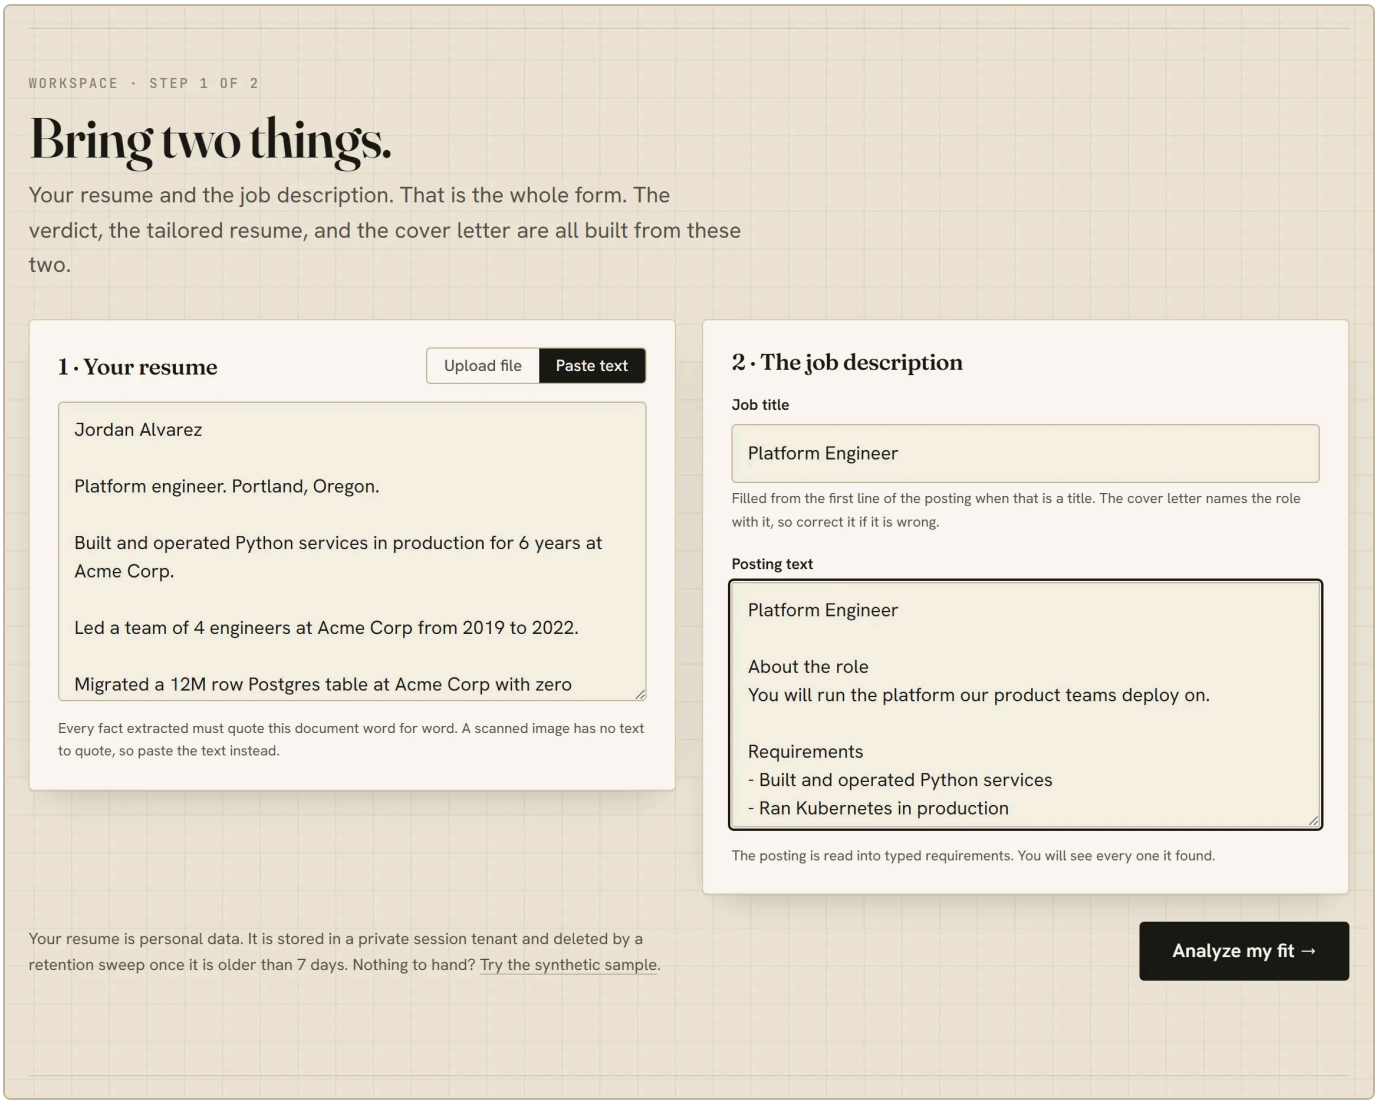

Open the workspace. Drop a PDF or docx on the left card, or switch to **Paste text** and paste the resume. Files are limited to 2 MB. A scanned image has no text, so paste instead.

The intake screen. Resume on the left, job description on the right. · synthetic data

2 Paste the job description

Paste the full posting on the right, including the qualifications section. The job title fills in from the posting's first line. Correct it if it is wrong, because the cover letter names the role with it. Then press **Analyze my fit**.

Both inputs filled in. One button runs everything. · synthetic data

3 Watch the build

Six steps run in order: a private session opens, the resume is stored, facts are extracted (each must quote your document word for word), the posting is stored and read into requirements, and your evidence is matched. If a step finds nothing to work with, the build stops and says why.

The build log. Every line is one real request, with its result. · synthetic data

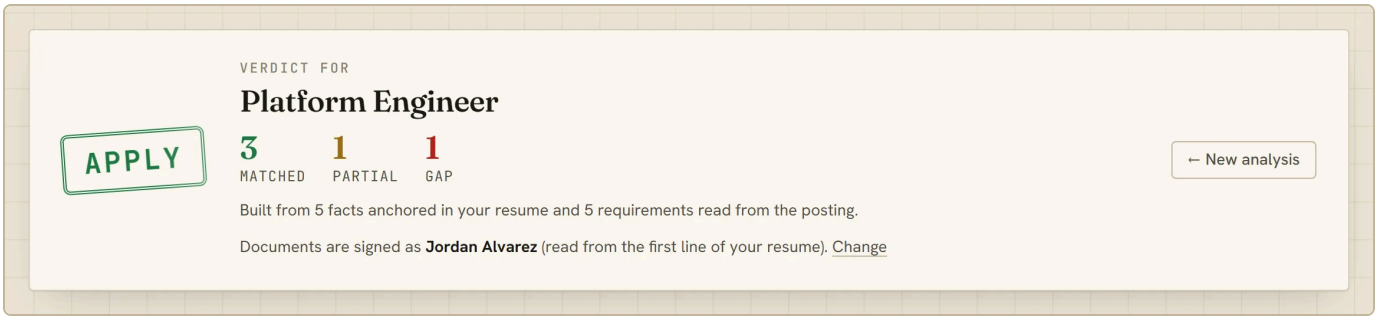

TASK 1

Career match: should you apply?

The first tab answers the question before you spend time on documents.

1 Read the verdict

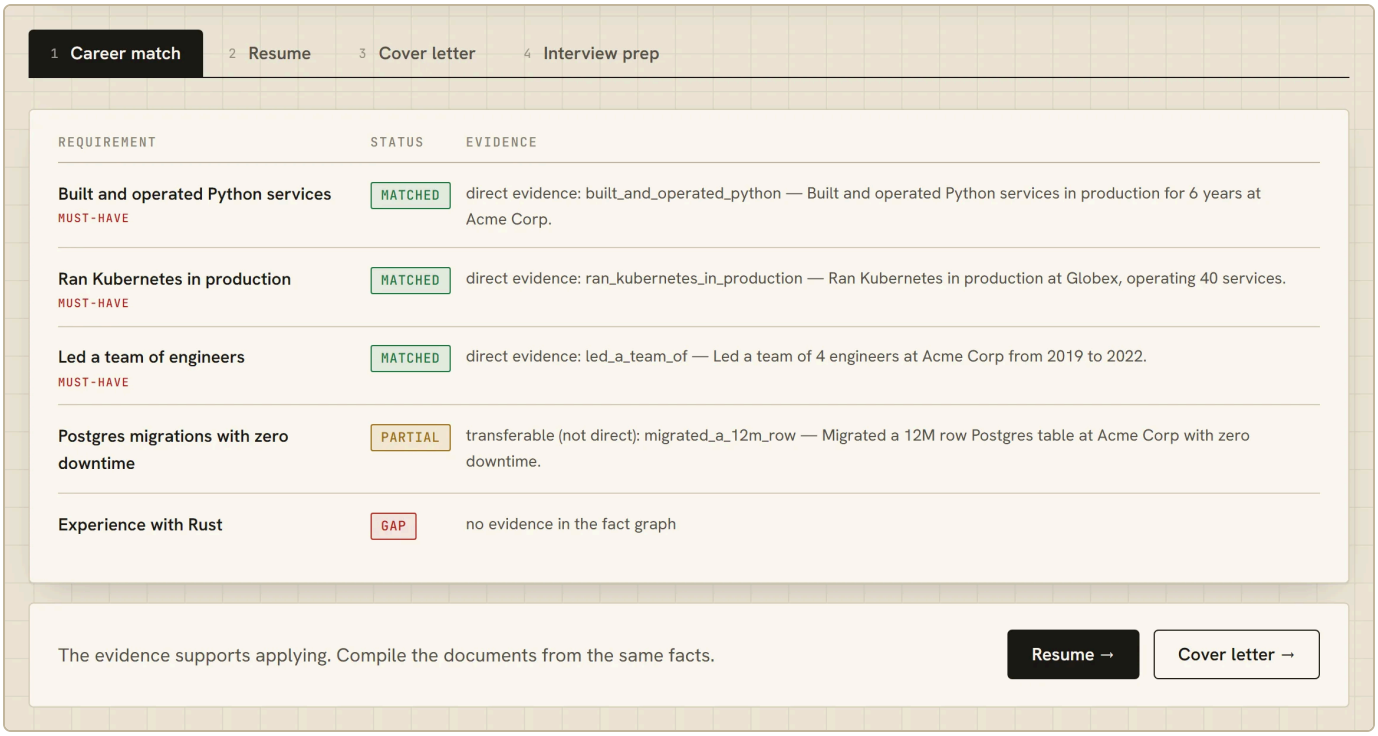

The stamp says **apply** or **do not apply**. Beside it, the count of requirements matched, partly matched, and missing. There is no percent score, because a percent would be invented. The same card shows the name your documents will be signed with, read from the first line of your resume. Press **Change** if it is wrong.

An apply verdict with its counts. · synthetic data

2 Check each requirement

The table lists every requirement in the posting's own words. **Matched** has direct evidence. **Partial** has related evidence. **Gap** has none. Must-haves are marked. The evidence column names the fact that earned the status.

Requirement by requirement, with the evidence named. · synthetic data

3 Take a do-not-apply seriously

When a must-have requirement has no evidence, the verdict is do not apply and the case against is written out. You can still compile documents, but they will only say what your facts support. The gap stays a gap.

The honest answer, from the sample posting with a planted must-have gap. · synthetic data

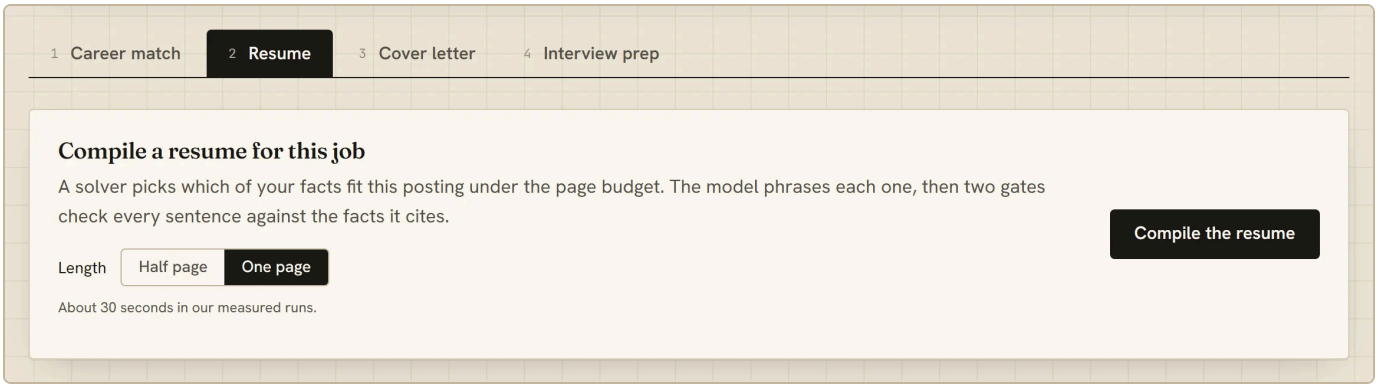

TASK 2

Resume: generate it, then modify it

The job chooses which of your facts make the page. It never rewords them to match the posting.

1 Pick a length and compile

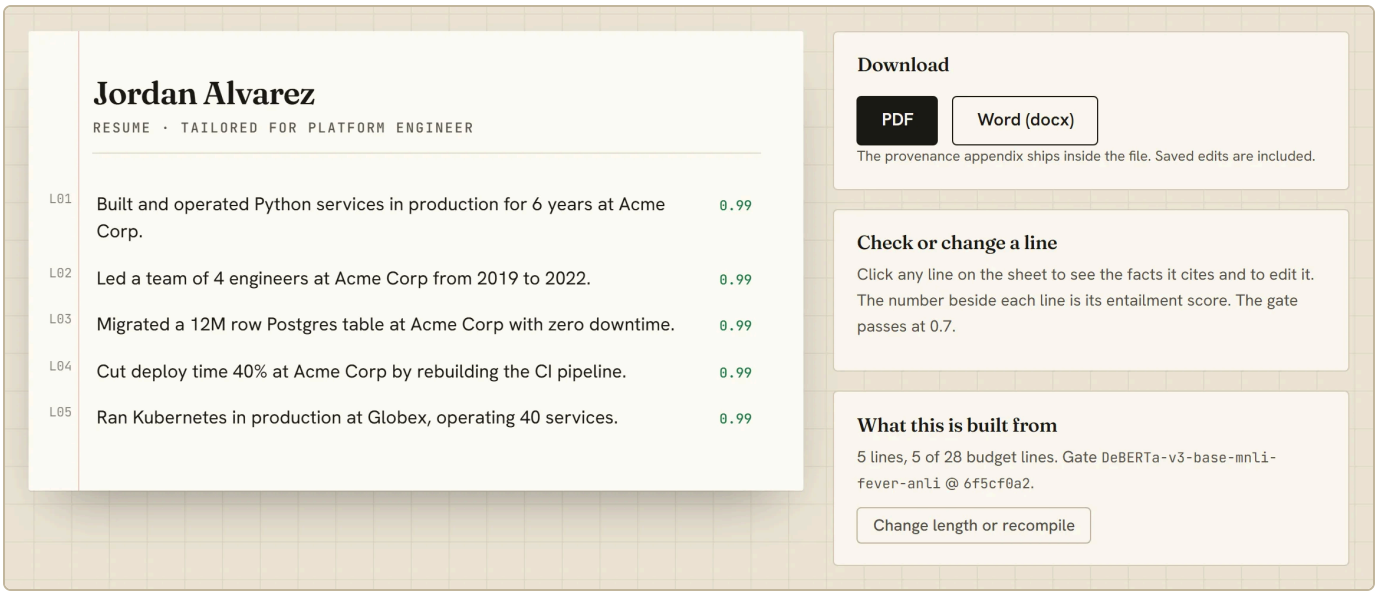

Open the **Resume** tab. Choose **Half page** or **One page**, then press **Compile the resume**. A solver picks the facts that fit this job under that budget. Compiling takes about 30 seconds in our measured runs.

Length is a budget. The solver decides what fits. · synthetic data

2 Read the sheet

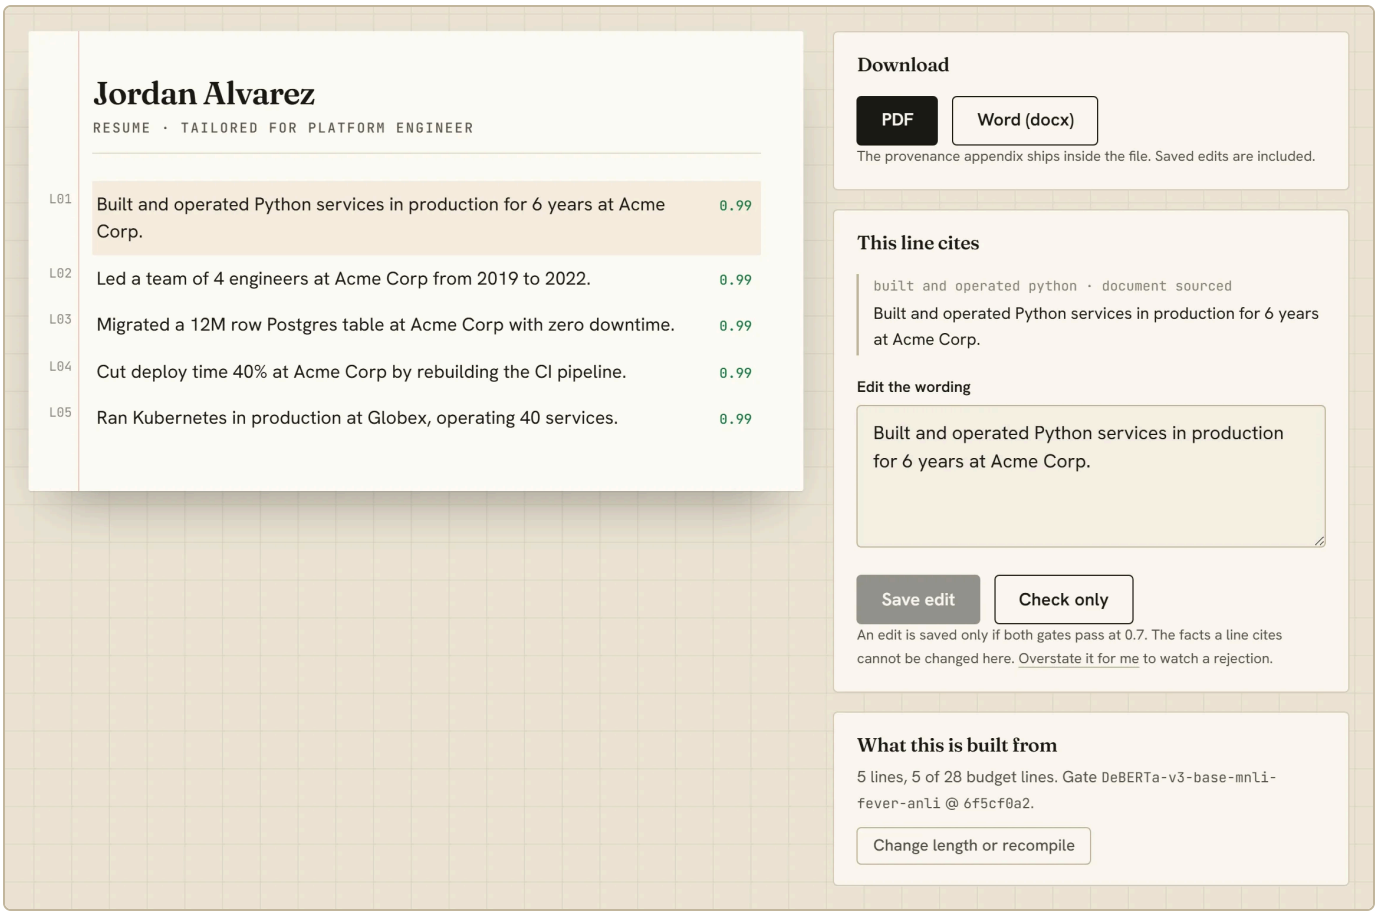

Each line shows its entailment score in the margin: how strongly the cited facts support the sentence. The right rail lists what was left out and the typed reason for each omission.

The compiled resume. Every line carries its score. · synthetic data

3 Click a line to see its evidence

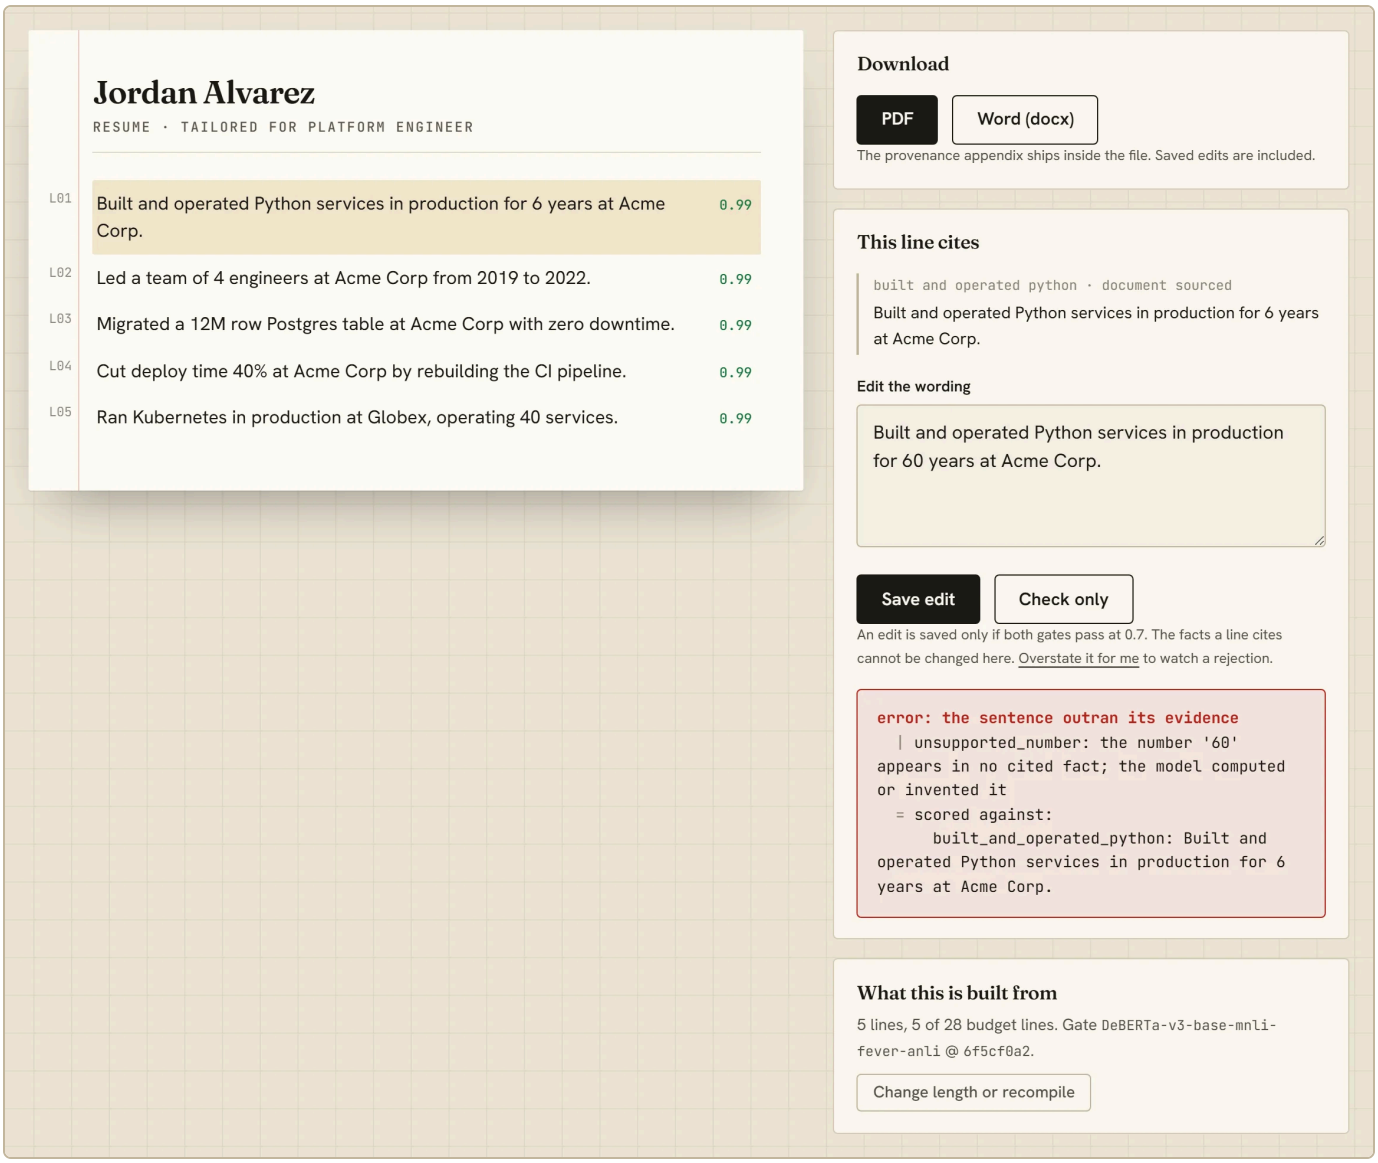

Select any line. The rail shows the facts it cites, each quoted from your own resume, and opens an editor for the wording.

One line, the facts that license it, and the editor. · synthetic data

4 Try to overstate it

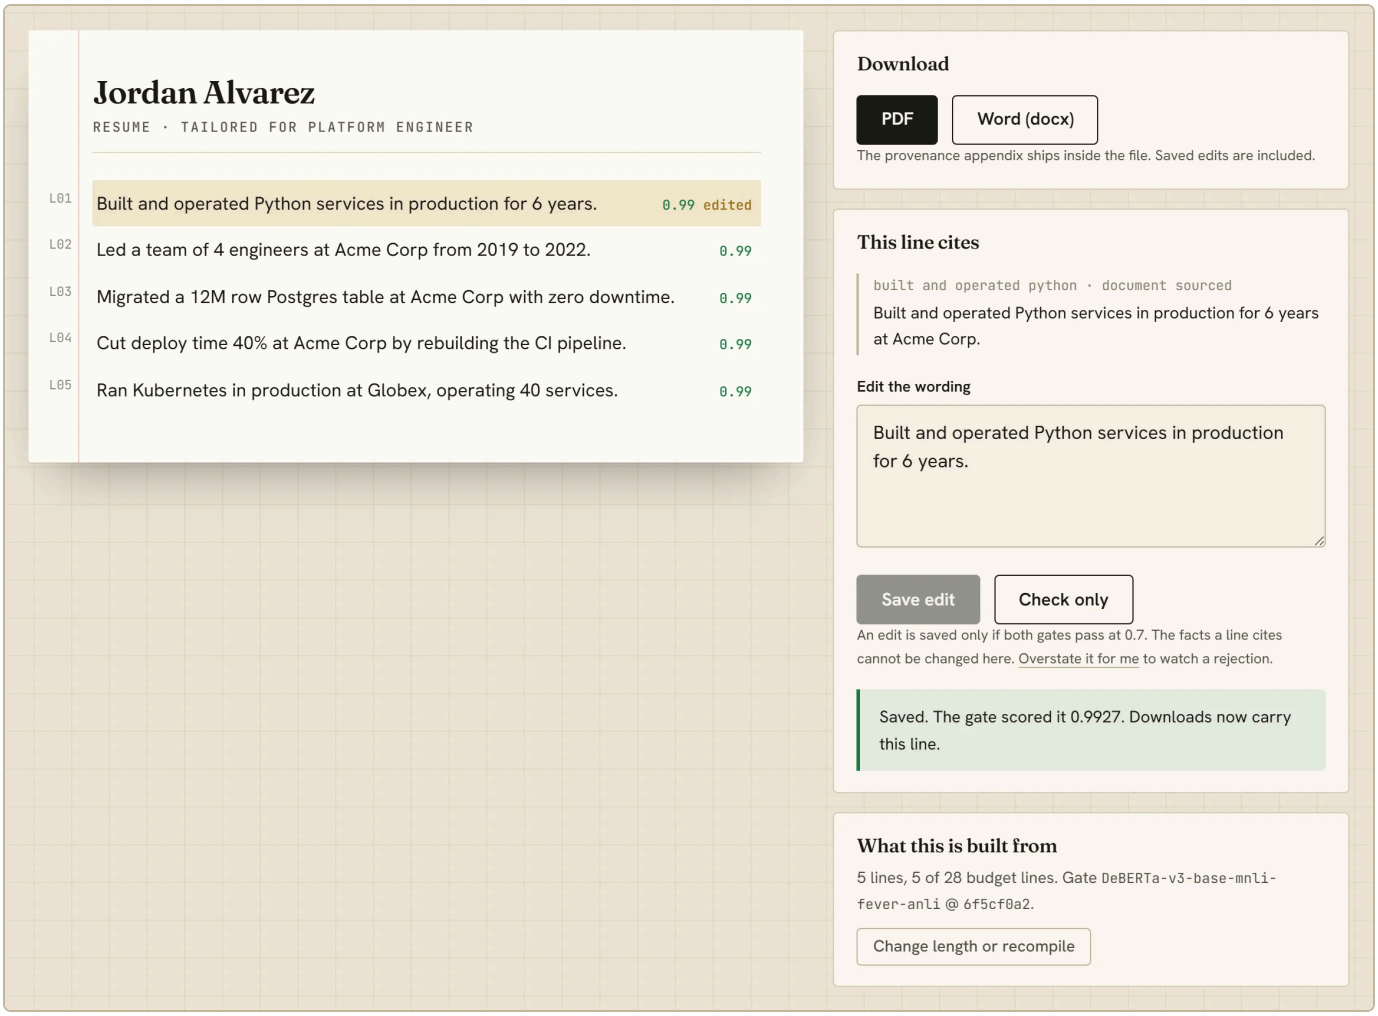

Change a number, or press **Overstate it for me**. The gate rejects the edit and shows why: the number is in no cited fact, or the entailment score fell under the threshold. Nothing is saved.

A rejected edit. The error names the evidence it was scored against. · synthetic data

5 Save an honest edit

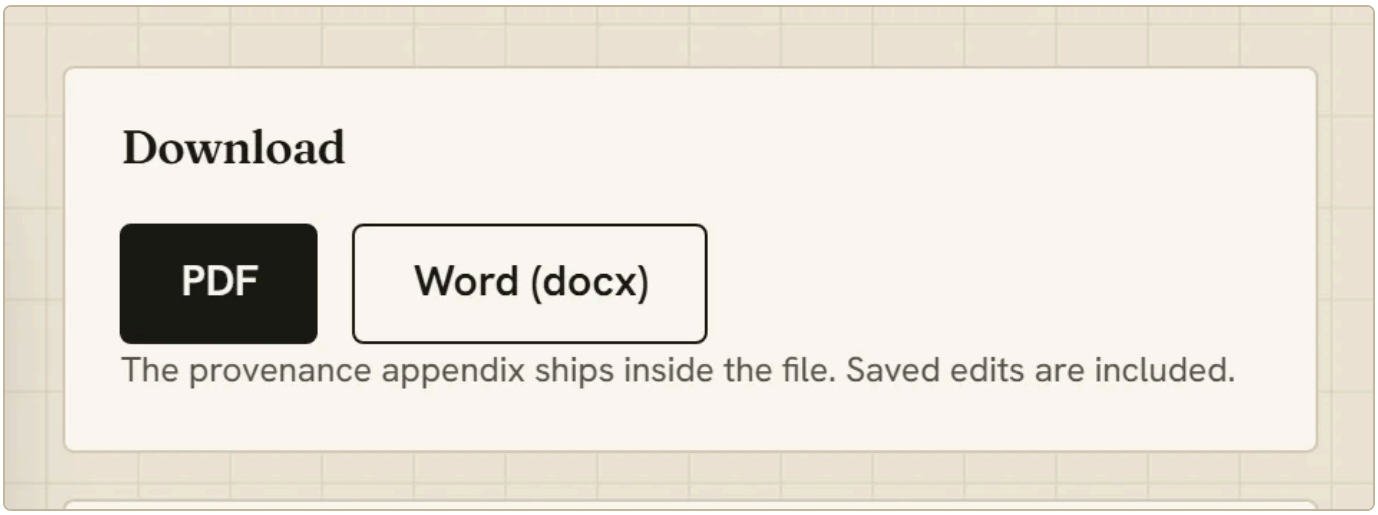

Reword the line without adding a claim, then press **Save edit**. Both gates run again. On a pass the line is replaced, marked edited, and the PDF and docx carry it. One line holds up to 600 characters.

A saved edit. Downloads now carry this line. · synthetic data

6 Download

Press **PDF** or **Word (docx)**. The file includes a provenance appendix mapping each line to its facts.

PDF and docx, each with its provenance appendix. · synthetic data

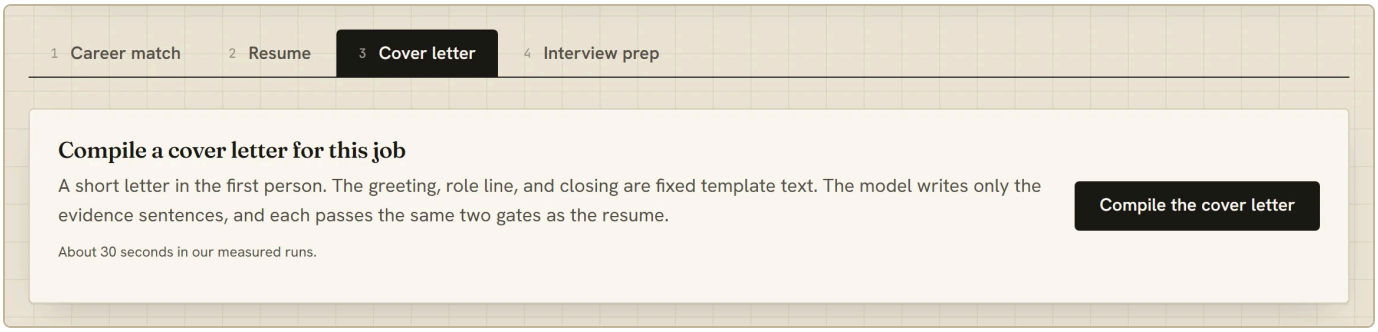

TASK 3

Cover letter

The same two gates as the resume. A letter is where overstating is most tempting, so it gets no exemption.

1 Compile the letter

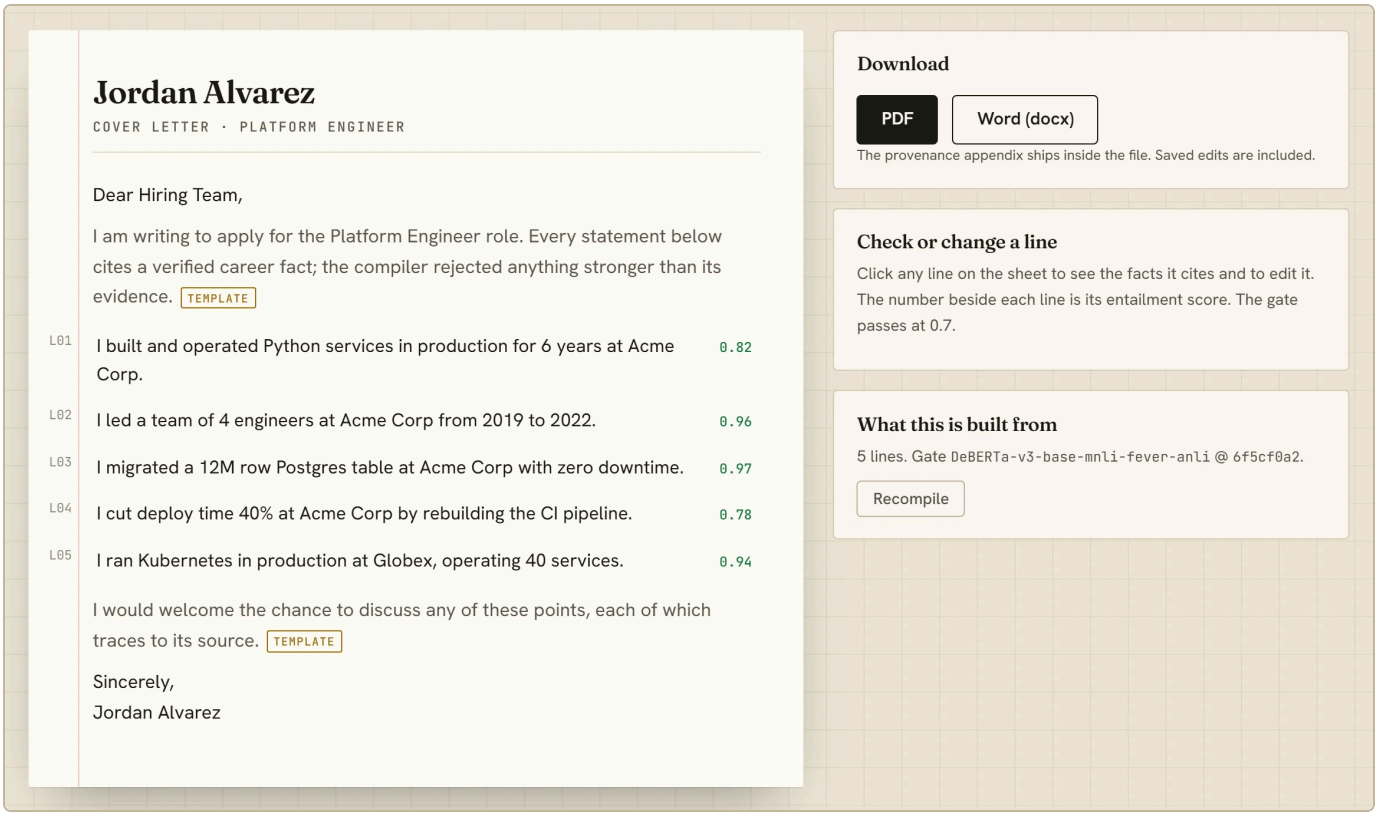

Open the **Cover letter** tab and press **Compile the cover letter**.

One button. No tone sliders, no invented enthusiasm. · synthetic data

2 Know which words are yours

Lines marked **template** are fixed text: the greeting, the role line, the closing. They claim nothing about you. The sentences between them were written from your facts and each passed the gate. Click one to see its evidence or edit it, exactly as on the resume.

Template frame, gated evidence sentences. · synthetic data

3 Download

PDF or docx, from the same rail. Saved edits are included.

Ready to attach. · synthetic data

ALSO

Good to know

The name on your documents

You are never asked for your name. It is read from the first line of your resume when that line is plainly a name. If it is not, you are asked to type it once. Either way you can change it from the verdict card, and the next download is signed with the new name.

Sessions end on their own

A session lasts 30 minutes and has a fixed request budget. When it ends you see one screen with one button. Start a new session and run the analysis again.

Interview prep

The fourth tab builds a prep pack from the compiled resume: the facts behind each line, the numbers you may quote, and the questions a skeptical interviewer would ask.

Nothing to hand?

The sample runs the same screens on an invented candidate and two invented postings, one of each verdict.
